~1,3 milliards
site web**

**Deep Web
~600 milliards
site web**

Introduction

L'internet est très vaste

Web de surface
~1,3 milliards
site web

Deep Web
~600 milliards
site web

Dark Web
~30 000 site web

Introduction

- These percentages are **not exact measurements**
- The internet size is impossible to fully map
- Deep web $\neq$ illegal (most of it is normal private data)

Introduction

Surface Web

- **~4% to 10% (very rough estimate)**
- Indexed by search engines (Google, Bing); accessible via standard browsers (Chrome, Safari).
- Example: public websites like news, blogs, Wikipedia, etc.

Deep Web

- **~90% or more (often cited 90–96%)**
- Not indexed by search engines (Password-protected or non-indexed;
- Includes
 - Legal, private data
 - Emails, private databases
 - Banking systems, Academic journals, Cloud storage

Dark Web

- **<1% of the internet (very small fraction)**
- Requires special access via Tor Browser (Intentionally hidden; requires encryption tools (Tor); known for anonymity)
- Includes **.onion** services inside the Tor

Dark Web

- Une partie très cachée du Deep Web
- Ensemble caché de sites web accessible uniquement par un navigateur spécifiquement conçu pour cette effet.
 - Accessed using tools like Tor (Tails, etc.)
- Inaccessible par les navigateurs traditionnels
- Peu de gens interagissent avec le Dark Web
- Aucune indexation de pages Web
 - Part of the internet not indexed by search engines
- Utilise un tunnel de circulation virtuel

Dark Web

The Dark Web can be used for both **legitimate privacy** and **illegal activities**

Dark Web

Used for both **legitimate privacy** and **illegal activities**

The same technology can be used for **good or bad purposes**.

- **Legitimate privacy**

People use tools like Tor to protect their identity. For example

- Journalists communicating safely
- Activists in restrictive countries
- Users avoiding tracking or censorship

- **Illegal activities**

The same anonymity can also be abused for

- Selling stolen data or drugs
- Cybercrime (hacking services, malware)
- Fraud and illegal marketplaces

TOR (The Onion Router)

- Tor released in **2002**
- Public use expanded around **2004**
 - Made anonymous browsing accessible to everyone
- Used for privacy, journalism, activism
- Later adopted for illegal activities as well
 - Led to what we call the “dark web” today

TOR (The Onion Router)

What is a Tor Circuit?

- A path your data takes through the Tor network
- Built to ensure **anonymity and privacy**

Comment y accéder ?

A standard Tor connection uses **at least 3 nodes (Guard → Middle → Exit)** to protect user identity.

TOR (The Onion Router)

Minimum Nodes (3 Hops)

1. Guard (Entry) Node

- First contact point
- Knows your IP but not the final destination

2. Middle Relay

- Passes encrypted traffic
- Cannot identify source or destination

3. Exit Node

- Sends traffic to the final website
- Knows destination but not the original user

TOR (The Onion Router)

Middle Relay (EASIEST & SAFEST)

Best for beginners

- Only forwards encrypted traffic between nodes
- Does **not connect directly to websites**
- No public complaints about traffic content

Why it's easiest

- Simple setup
- Low legal/operational risk
- No responsibility for exit traffic

Recommended choice for most people

TOR (The Onion Router)

Guard / Entry Node (MEDIUM DIFFICULTY)

First hop in the Tor circuit

- Receives traffic from users
- Knows user IP, but not destination

Considerations

- Requires **good uptime and bandwidth**
- More stable and trusted node role
- Slightly more responsibility than middle relay

Used by more experienced operators

TOR (The Onion Router)

Exit Node (HARDEST & RISKIEST)

Most sensitive role

- Sends traffic to the public internet
- Websites see *your IP address* as source

Why it's difficult

- High risk of **abuse complaints or legal issues**
- Needs strong monitoring and clear policies
- Requires technical and legal awareness

Only for advanced operators or organizations

In the dark web (Tor), websites are **almost always .onion addresses**.

TOR (The Onion Router)

- Some regular websites (like news sites) have **both**
 - A normal domain (.com)
 - A .onion version for privacy

But **inside Tor itself**, hidden services = .onion

Exemple de contenu

- [Guns Dark Market](#) - Guns market to buy guns, full auto assault rifles, pistols, grenade launchers, etc.
- [Cstore - The original CardedStore](#) - Electronics purchased with cash giftcards, Everything Brand new. Full escrow accepted
- [Apple Palace](#) - low priced Apple Products!
- [Gold & Diamonds](#) - Genuine Gold, Diamonds and Rhino Horn shipped from Germany and USA.
- [Football Money](#) - Fixed football games info.
- [Darknet Hacking Services](#) - Hacker-for-hire collective providing a network of professional hacking services.
- [EuroGuns](#) - Your #1 european arms dealer.
- [USfakeIDs](#) - High quality USA Fake Drivers Licenses.
- [Fake Passport ID sale](#) - Website selling qualitative EU/US/AUS/CA fake passports, ID cards and driver's licenses.

VPN

Security Levels in Tor Browser

Standard Mode (Default)

- Full website functionality enabled
- JavaScript allowed
- Best compatibility with websites
 - Normal browsing with Tor protection

Safer Mode

- Disables risky web features
 - Some JavaScript features restricted
 - Fewer fonts and media elements
- Improves security and privacy
 - Balance between usability and protection

Safest Mode

- Maximum security level
- JavaScript disabled completely
- Only static content loads
 - Strong protection but many websites may break

Security Levels in Tor Browser

- Higher security = **less website functionality**
- Lower security = **better browsing experience but more risk**

Tails OS (More Secure Alternative)

- Tails, or "The Amnesic Incognito Live System"
- A live operating system started from USB (or DVD?)
- Designed for **privacy and anonymity**

Why Tails is More Secure

- **Amnesic system** → leaves no trace after shutdown
- Forces all internet traffic through Tor
- No data stored on the computer hard drive
- Pre-configured security tools (encryption, privacy settings)

Exemple de service d'attaque vendu sur le DarkWeb

Quelques chiffres pour illustrer le marché de la cybercriminalité

- Le tarif moyen de location pour 1 heure d'un **botnet** qui est un système permettant de saturer un site internet est de 5\$.
- Le prix de commercialisation du **malware** « Citadel » permettant d'intercepter des numéros de carte bancaire est de 2399\$ (plus un abonnement mensuel de 125 \$).

Why Organizations Care

- **Data breaches (leaked credentials, databases)**

When attackers hack a company, they steal sensitive data like emails, passwords, or full databases and publish or share them on hidden platforms (often accessed via Tor).

Risk: attackers can reuse passwords or access accounts.

Why Organizations Care

- **Sale of stolen information**

Stolen data (credit cards, login details, personal info) is **sold to other criminals**.

Example: a database of user emails/passwords sold in bulk.

Why Organizations Care

Cybercrime marketplaces

Online black markets where criminals trade

- Hacking tools
- Malware
- Stolen accounts/data
- Illegal services (e.g., DDoS-for-hire)

These operate like “e-commerce” sites but for illegal activities.

Why Organizations Care

Reputation damage

If a company's data appears on the dark web

- Customers lose trust
- Brand image is harmed
- Financial and legal consequences may follow

Why Organizations Care

Reputation damage

If a company's data appears on the dark web

- Customers lose trust
- Brand image is harmed
- **Financial and legal consequences may follow?!**
 - **What does it mean?**

Why Organizations Care

- **Financial and legal consequences may follow?!**
 - **Financial consequences**
Costs for fixing the breach, compensating users, fines, and loss of customers/revenue.
 - **Legal consequences**
Lawsuits from affected users and penalties for not protecting data or violating regulations (e.g., General Data Protection Regulation).
 - Equivalent of GDPR in Algeria?

Dark Web Monitoring

- Continuous scanning of hidden forums & marketplaces
 - How?
- Or Use of threat intelligence platforms

Goal

- Detect leaked emails, passwords, documents
- **Early detection of threats**
- Stay updated on potential threats in real time.

Dark Web Monitoring

- **Continuous scanning of hidden forums & marketplaces**

Organizations use specialized tools (often accessing networks like Tor) to **regularly monitor dark web sites** where hackers communicate and trade data.

They search for **their company's data** (employee emails, credentials, internal files).

If found early, they can **reset passwords and limit damage**.

Why Organizations Care

Use of threat intelligence platforms

Companies rely on cybersecurity platforms that

- Collect data from the dark web
- Analyze and filter useful information
- Send alerts about risks

Examples include platforms from companies like Recorded Future, Darktrace, Intrinsec.

How companies scan the dark web

Automated crawling (controlled access)

- Companies run **custom crawlers** inside the Tor
- These bots **visit known onion directories, forums, and marketplaces**
- They don't rely on Google-style indexing (they follow links inside dark web communities)

How companies scan the dark web

Automated crawling (controlled access)

- Companies run **custom crawlers** inside the Tor
- These bots **visit known onion directories, forums, and marketplaces**
- They don't rely on Google-style indexing (they follow links inside dark web communities)

Seed lists (known entry points)

- Analysts maintain lists of
 - Known **.onion** sites
 - Forums
 - Leak sites
- Crawlers start from these “seed” URLs and expand from there

How companies scan the dark web

Threat intelligence platforms

- Specialized systems collect and analyze dark web data, e.g.: Recorded Future and Darktrace
- They aggregate data from multiple sources (dark web + leaks + forums)

Human intelligence (analysts)

- Cybersecurity experts manually monitor
 - Private forums
 - Invite-only marketplaces
- Some areas cannot be fully automated

Conclusion

The dark web itself is just a **technology (anonymous network)**

What becomes illegal is

- buying/selling illegal goods
- accessing criminal services
- participating in cybercrime
- etc.
